

## 2-AMINOCARBONYL-9H-PURINE DERIVATIVES

This invention relates to purine derivatives. More particularly, this invention relates to 2-aminocarbonyl-9H-purine derivatives and to processes for the preparation of, intermediates used in the preparation of, compositions containing and the uses of, such derivatives.

These derivatives are selective, functional agonists of the human adenosine A2a receptor and may be used as anti-inflammatory agents in the treatment of, *inter alia*, diseases of the respiratory tract.

Adenosine is a ubiquitous molecule having a central role in mammalian intermediary metabolism. Independently, adenosine acts on multiple surface receptors to produce a variety of responses. Adenosine receptor classification has revealed the presence of at least four subtypes: A1, A2a, A2b and A3. Stimulation of adenosine A2 receptors on the surface of human neutrophils has been reported to potentially inhibit a range of neutrophil functions. Activated neutrophils can damage lung tissue by release of reactive oxygen species, for example, superoxide anion radicals ( $O_2^{\cdot-}$ ), and granule products, for example, human neutrophil elastase (HNE), amongst other inflammatory mediators. In addition, activated neutrophils perform both *de novo* synthesis and release of arachidonate products such as leukotriene B<sub>4</sub> (LTB<sub>4</sub>). LTB<sub>4</sub> is a potent chemo-attractant that recruits additional neutrophils to the inflammatory focus, whereas released  $O_2^{\cdot-}$  and HNE adversely affect the pulmonary extracellular matrix. The A2 receptor subtype mediating many of these responses ( $O_2^{\cdot-}$  and LTB<sub>4</sub>/HNE release and cell adhesion) is established as A2a. The A2 subtype (A2a or A2b) mediating the other effects remains to be established.

Selective agonist activity at the A2a receptor is considered to offer greater therapeutic benefit than the use of non-selective adenosine receptor agonists because interaction with other subtypes is associated with detrimental effects in the lung in animal models and human tissue studies. For example, asthmatics, but not non-asthmatics, bronchoconstrict when challenged with inhaled adenosine. This response is at least in part due to the activation of the A1 receptor subtype. Activation of A1 receptors also promotes neutrophil

chemotaxis and adherence to endothelial cells, thus promoting lung injury. Furthermore, many patients with respiratory disease will be co-prescribed  $\beta_2$ -agonists, and negative interaction has been shown in animal studies between isoprenaline and adenosine receptors negatively coupled to adenylate cyclase.

- 5 Degranulation of human mast cells is promoted by activation of adenosine A2b receptors, thus selectivity over the A2b receptor is also advantageous.

We have now surprisingly found the present purine derivatives inhibit neutrophil function and are selective agonists of the adenosine A2a receptor. They may also have antagonist activity at the adenosine A3 receptor. The

10 present compounds may be used to treat any disease for which an adenosine A2a receptor agonist is indicated. They can be used to treat a disease where leukocyte (e.g. neutrophil, eosinophil, basophil, lymphocyte, macrophage) - induced tissue damage is implicated. They are useful as anti-inflammatory agents in the treatment of diseases of the respiratory tract such as adult

15 respiratory distress syndrome (ARDS), bronchitis, chronic bronchitis, chronic obstructive pulmonary disease, cystic fibrosis, asthma, emphysema, bronchiectasis, chronic sinusitis and rhinitis. The present compounds may also be used in the treatment of septic shock, male erectile dysfunction, male factor infertility, female factor infertility, hypertension, stroke, epilepsy, cerebral

In the above preferred groups, "Et" means ethyl, "iPr" means isopropyl, "nBu" means n-butyl and "Ph" means phenyl.

Particularly preferred embodiments of a compound of the formula (I) are those of the Examples section hereafter, particularly those of Examples 8 and 5 34, together with pharmaceutically acceptable salts and solvates thereof.

The compounds of the formula (I) can be prepared using conventional procedures such as by the following illustrative methods in which  $R^1$ ,  $R^2$ ,  $R^3$ ,  $R^4$ ,  $R^5$ ,  $R^{15}$ , X and Y are as previously defined for a compound of the formula (I) unless otherwise stated.

10

1. A compound of the formula (I) wherein Y is CO may be prepared by reaction of a compound of the formula:

15

(II)

with a compound of the formula:

20

(III)

wherein  $Z^1$  is a suitable leaving group such as chloro or 1H-imidazol-1-yl.

In a typical procedure the compounds are reacted together in a suitable solvent such as toluene, isopropanol or dichloromethane, or any combination thereof, optionally with heating such as at the reflux temperature of the solvent.

The compounds of the formula (III) may be prepared by conventional  
5 procedures.

A compound of the formula (II) may be prepared as shown in Scheme 1.

Scheme 1

## Scheme 1 (continued)

5

wherein  $R^{16}$  is  $C_1$ - $C_4$  alkyl,  $R^{17}$  is a suitable protecting group such as tetrahydro-2H-pyran-2-yl,  $R^{18}$  is a suitable ester-forming group such as  $C_1$ - $C_6$  alkyl or benzyl, preferably  $C_1$ - $C_4$  alkyl, and  $R^{19}$  and  $R^{20}$  are either each a suitable protecting group such as acetyl or benzoyl, or, taken together, are a suitable protecting group such as  $C_1$ - $C_6$  alkylene optionally substituted by phenyl, e.g. 1,1-dimethylmethylene or phenylmethylene.

In a typical procedure, where  $R^{17}$  is tetrahydro-2H-pyran-2-yl, a chloropurine of the formula (IV) is N-protected by reaction with 3,4-dihydro-2H-pyran in the presence of a suitable acid catalyst such as p-toluenesulphonic acid (PTSA), benzenesulphonic acid, camphorsulphonic acid, hydrochloric acid, sulphuric acid, methanesulphonic acid or pyridinium p-toluenesulphonate, and

15

in a suitable solvent such as ethyl acetate, toluene, dichloromethane, dimethylformamide (DMF), tert-butyl methyl ether, diisopropyl ether, tetrahydrofuran (THF) or acetonitrile, at from 0°C to the reflux temperature of the solvent. Preferably the reaction is carried out in ethyl acetate in the  
 5 presence of PTSA with heating. Other suitable protecting groups R<sup>17</sup> are mentioned in the Greene *et al* reference mentioned herein.

A compound of the formula (V) prepared may be converted to an amine of the formula (VI) by reaction with a compound of the formula:

The compounds are reacted in the presence of a suitable acid acceptor, e.g.  
 15 triethylamine, 4-methylmorpholine or N-ethyldiisopropylamine, and in a suitable solvent such as methanol, ethanol or isopropanol at from room temperature to the reflux temperature of the solvent. Preferably, N-ethyldiisopropylamine and isopropanol are used under reflux conditions.

An amine of the formula (VI) is then reacted with a sodium or potassium  
 20 thioalkoxide in a suitable solvent such as dimethylsulphoxide(DMSO), DMF or 1-methyl-2-pyrrolidinone, at from room temperature to the reflux temperature of the solvent. Preferably, sodium or potassium thiomethoxide in DMF at 100°C are used as the reaction conditions.

A thioether of the formula (VII) prepared is then oxidised to a sulphone of  
 25 the formula (VIII) using a suitable oxidant such as Oxone (trade mark) (potassium peroxymonosulphate), dimethyl dioxirane, m-chloroperbenzoic acid or peracetic acid, optionally in the presence of a suitable base, e.g. sodium bicarbonate, and in a suitable solvent such as aqueous acetone or dichloromethane, at a temperature of from room temperature to 50°C.  
 30 Preferably, Oxone (trade mark) and sodium bicarbonate are used in a aqueous acetone at room temperature.

A sulphone of the formula (VIII) may be converted to a nitrile of the formula (IX) by reaction with a suitable cyanide source such as potassium cyanide, zinc cyanide, sodium cyanide or copper cyanide, and in a suitable solvent such as DMSO, DMF, 1-methyl-2-pyrrolidinone, THF or acetonitrile, at a temperature of from room temperature to the reflux temperature of the solvent. Preferred conditions are potassium cyanide in DMF at 120°C.

Alternatively, a chloropurine of the formula (VI) may be converted to a nitrile of the formula (IX) using a suitable cyanide source, e.g. potassium cyanide, zinc cyanide, sodium cyanide or copper cyanide, and in a suitable solvent, e.g. DMF, DMSO, 1-methyl-2-pyrrolidinone, THF or acetonitrile, optionally in the presence of a suitable palladium catalyst, e.g. tetrakis(triphenylphosphine)palladium(0), or palladium(II) acetate in combination with triphenylphosphine, tri-*o*-tolylphosphine, (*R*)- or (*S*)- or racemic-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl or 1,1'-bis(diphenylphosphino)ferrocene, and optionally in the presence of a suitable base, e.g. triethylamine, 4-methylmorpholine or N-ethyldiisopropylamine, at temperature of from room temperature to the reflux temperature of the solvent (optionally under pressure). Alternatively the reaction may be carried out by reacting a chloropurine of the formula (VI) with sodium or potassium cyanide in a suitable solvent such as DMSO, 1-methyl-2-pyrrolidinone or DMF, at from room temperature to the reflux temperature of the solvent. Preferably the reaction is carried out using zinc cyanide, triethylamine and tetrakis(triphenylphosphine)palladium(0) in DMF at 80-85°C under an elevated argon pressure.

A nitrile of the formula (IX) may be deprotected to provide a nitrile of the formula (X) under conventional conditions. For example, where R<sup>17</sup> is tetrahydro-2H-pyran-2-yl, the deprotection may be carried out in the presence of a suitable acid as hydrochloric acid, trifluoroacetic acid, sulphuric acid, trichloroacetic acid, phosphoric acid, p-toluenesulfonic acid, benzenesulphonic acid, methanesulphonic acid or camphorsulphonic acid, and in a suitable solvent such as a C<sub>1</sub>-C<sub>4</sub> alkanol that may optionally contain water, preferably at an elevated temperature such as the reflux temperature of the solvent. The pH may be adjusted to between pH8 and pH11 in the work-up procedure with an

aqueous base such as sodium hydroxide, potassium hydroxide, sodium carbonate or potassium carbonate to generate the free base of the compound of the formula (X). Preferred conditions are using 2M aqueous hydrochloric acid in ethanol at room temperature or using trifluoroacetic acid in aqueous isopropanol under reflux conditions, followed by adjustment of the pH in the work-up to from pH 9-10.5 with aqueous sodium hydroxide solution.

A nitrile of the formula (X) may be converted to an ester of the formula (XII) by reaction with a sodium or potassium C<sub>1</sub>-C<sub>4</sub> alkoxide in a corresponding C<sub>1</sub>-C<sub>4</sub> alkanol solvent, optionally at an elevated temperature, and including an acid treatment during the work-up. Preferably, the reaction is carried out using sodium methoxide in methanol at the reflux temperature, with treatment with aqueous hydrochloric acid during the work-up.

Alternatively, an ester of the formula (XII) may be prepared by carbonylation of a compound of the formula (VI) with a compound of the formula:

using carbon monoxide, optionally under pressure, together with a suitable palladium catalyst in the presence of a suitable base, e.g. a tertiary amine base, and optionally at an elevated temperature, to provide a compound of the formula:

Typically, a catalytic quantity of palladium (II) acetate together with a suitable ligand such as 1,1'-bis(diphenylphosphino)ferrocene, triphenyl phosphine, tri-*o*-tolyl phosphine or BINAP ((*R*)- or (*S*)- or racemic-2,2'-bis(diphenylphosphino)-1,1'-binaphthyl), a suitable alcohol of the formula  $R^{18}OH$ , e.g. methanol, ethanol, 1-propanol, isopropanol, or 1-butanol (employed as the solvent also) and a base such as a triethylamine, Hunigs base (ethyldiisopropylamine), 4-methylmorpholine, sodium carbonate, sodium hydrogencarbonate, potassium carbonate or caesium carbonate, are used under carbon monoxide, optionally under 1-3000kPa pressure in a sealed vessel at from 20 to 200°C. A compound of the formula (VIA) may be deprotected to provide a compound of the formula (XII) using suitable deprotection conditions such as those described for the conversion of a compound of the formula (IX) to a compound of the formula (X).

The ester of the formula (XII) may be coupled with a compound of the formula:

(XI)

wherein  $Z^2$  is a suitable leaving group such as acetoxy, benzoyloxy, methoxy or halo, e.g. chloro, and  $R^{19}$  and  $R^{20}$  are suitable protecting groups as previously defined, in the presence of a suitable acid or Lewis acid, e.g. trimethylsilyl trifluoromethanesulphonate, preferably using an excess thereof. The reaction can be performed using a compound of the formula (XI) in the form of a 2*R*- or 2*S*- diastereoisomer, or as an epimeric mixture thereof. The reaction is typically carried out in a suitable solvent, e.g. 1,2-dimethoxyethane, dichloromethane, acetonitrile, 1,1,1-trichloroethane or toluene, or a mixture thereof, preferably by pre-treating the compound of the formula (XII) *in situ* with a suitable silylating agent, e.g. trimethylsilyl trifluoromethanesulphonate, N,O-

bis(trimethylsilyl)acetamide, trimethylsilyl chloride or hexamethyldisilazane, optionally in the presence of a tertiary amine base, e.g. N-methylmorpholine, before adding a compound of the formula (XI). Elevated temperatures may be used in the reaction. Preferred conditions involve treating a compound of the  
 5 formula (XII) first with N,O-bis(trimethylsilyl)acetamide in 1,1,1-trichloroethane, heating the reaction under reflux, before treatment with a solution of a compound of the formula (XI) and trimethylsilyl trifluoromethanesulphonate in toluene and then heating at above 100°C. It will be appreciated that where a compound of the formula (XI) wherein R<sup>5</sup> is CH<sub>2</sub>OH is to be used, the hydroxyl  
 10 group may be suitably protected for the purpose of this reaction (see later R<sup>5A</sup> definition), which can then be deprotected in the subsequent transformation to provide a compound of the formula (XIV).

Deprotection of a compound of the formula (XIII) may be achieved using conventional conditions, e.g., where R<sup>19</sup> and R<sup>20</sup> are each acetyl or benzoyl,  
 15 under basic conditions such as using sodium hydroxide, potassium hydroxide, lithium hydroxide, sodium carbonate, potassium carbonate or caesium carbonate in a solvent such as methanol, ethanol, isopropanol, 1,2-dimethoxyethane, THF, DMF, acetone, 2-butanone or 4-methyl-2-pentanone, optionally also in the presence of water, at a temperature of from 0 to 80°C.  
 20 Alternatively, either a tertiary amine base such as triethylamine, diisopropylethylamine or 4-methylmorpholine, in an alcohol solvent such as methanol, ethanol, isopropanol or 1-propanol may be used at a temperature of from 0 to 80°C, or a sodium or potassium C<sub>1</sub>-C<sub>4</sub> alkoxide, e.g. sodium methoxide or ethoxide, in a corresponding C<sub>1</sub>-C<sub>4</sub> alkanol, e.g. methanol or  
 25 ethanol, may be used. Further, an amine such as ammonia, methylamine, ethylamine, dimethylamine and a suitable solvent such as methanol, ethanol, isopropanol, THF or dichloromethane can be used at a temperature of from 0 to 80°C. Preferably, sodium carbonate in methanol at room temperature is used.

An ester of the formula (XIV) may be converted to an amide of the  
 30 formula (II) by reaction with a compound of the formula:

(XV)

, optionally at an elevated temperature, optionally in an inert solvent such as  
 5 1,2-dimethoxyethane or 2-methoxyethyl ether and optionally under pressure.  
 Preferably, the reaction is carried out in the absence of solvent at a  
 temperature of from 100-120°C. The skilled person will appreciate that to  
 achieve the desired regioselectivity, a suitable protecting group (e.g.  
 trifluoroacetyl) may optionally be used for this reaction located on a chosen N  
 10 atom of a compound of the formula (XV), and the protected intermediate  
 prepared subsequently deprotected.

A compound of the formula (II) may also be prepared by  
 aminocarbonylation reaction of a compound of the formula (XVII) with a  
 compound of the formula:

15

(XV)

20 by a similar procedure to that described for the conversion of a compound of  
 the formula (XVII) to a compound of the formula (I) below. The skilled person  
 will appreciate that to achieve the desired regioselectivity, a suitable protecting  
 group (e.g. trifluoroacetyl) may optionally be used for this reaction located on a  
 chosen N atom of a compound of the formula (XV) ), and the protected  
 25 intermediate prepared subsequently deprotected.

A compound of the formula (XI) or (XV) may be prepared by  
 conventional procedures.

30 2. The compounds of the formula (I) wherein Y is CO may be prepared by  
 aminocarbonylation reaction of a compound of the formula:

(XVII)

- 5 wherein Z<sup>3</sup> is a suitable leaving group such as bromo, iodo, -Sn(C<sub>1</sub>-C<sub>12</sub> alkyl)<sub>3</sub> or CF<sub>3</sub>SO<sub>2</sub>O-, preferably iodo, with a compound of the formula:

10 (XVIII)

in the presence of carbon monoxide and a suitable coupling catalyst (it will be appreciated that this route may also be used for compounds of the formula (I) where Y is other than CO). Preferably, the catalyst is a palladium (II) catalyst, more preferably 1,1'-bis(diphenylphosphino)ferrocenedichloropalladium (II) (optionally as a 1:1 complex with dichloromethane). Alternatively, palladium (II) acetate may be used in the presence of a suitable ligand such as 1,1'-bis(diphenylphosphino)ferrocene, triphenylphosphine, tri(o-tolyl)phosphine or (R)-, (S)- or racemic 2,2'-bis(diphenylphosphino)-1,1'-binaphthyl.

20 In a typical procedure the reaction is carried out in a sealed vessel in the presence of carbon monoxide at an elevated pressure, e.g. about 345kPa (50psi), at an elevated temperature, e.g. about 60°C, and in a suitable solvent, e.g. tetrahydrofuran, methanol or ethanol. Optionally, a suitable organic base may be present such as tertiary amine, e.g. triethylamine, N-ethyl-diisopropylamine or 4-methylmorpholine.

The intermediates of the formula (XVII) can be prepared as shown in Scheme 2.

Scheme 2

wherein,  $R^{5A}$  is as defined hereafter,  $Z^3$  is as previously defined for a compound of the formula (XVII) and "Ac" is acetyl (although it will be appreciated that alternative suitable protecting groups as exemplified herein may be used in this transformation).

10

In a typical procedure a compound of the formula (XIX) is reacted with an amine of the formula:

15

(XVI)

in the presence of a suitable acid acceptor, e.g. triethylamine, and in a suitable solvent, e.g. acetonitrile, at an elevated temperature, if necessary. The product of the formula (XX) obtained can be deprotected by hydrolysis to provide a compound of the formula (XVII) by a conventional procedure such as by using a suitable inorganic base, e.g. sodium carbonate, sodium hydroxide, potassium hydroxide, lithium hydroxide, sodium carbonate, potassium carbonate or caesium carbonate, and in a suitable solvent, e.g. methanol, ethanol, isopropanol, 1,2-dimethoxyethane, tetrahydrofuran, dimethylformamide, acetone, 2-butanone or 4-methyl-2-pentanone, optionally under aqueous

20

25

conditions, at from 0°C to the reflux temperature of the solvent, e.g. room temperature. Alternatively, the deprotection can be carried out using a suitable amine base such as triethylamine, diisopropylethylamine, 4-methylmorpholine, ammonia, methylamine, ethylamine or dimethylamine in a suitable solvent such as methanol, ethanol, n-propanol, isopropanol, tetrahydrofuran or dichloromethane at from 0°C to the reflux temperature of the solvent.

An intermediate of the formula (XIX) can be prepared by a conventional procedure.

An intermediate of the formula (XVIII) may be prepared by reacting a compound of the formula:

(XV)

with a compound of the formula:

(III)

under similar conditions to those previously described for the conversion of compounds of the formulae (II) and (III) to a compound of the formula (I). The skilled person will appreciate that to achieve the desired regioselectivity, a suitable protecting group (e.g. trifluoroacetyl) may optionally be used for this reaction located on a chosen N atom of a compound of the formula (XV) and the protected intermediate prepared subsequently deprotected.

3. A compound of the formula (I) wherein Y is CO may be prepared by deprotection of a compound of the formula:

(XXI)

- 5 wherein  $R^{21}$  and  $R^{22}$  are either each a suitable protecting group such as acetyl or benzoyl, or, taken together, are a suitable protecting group such as  $C_1$ - $C_6$  alkylene optionally substituted by phenyl, e.g. 1,1-dimethylmethylene or phenylmethylene,  $R^{5A}$  is  $CH_2OH$ ,  $CH_2OR^{23}$  or  $CONR^{14}R^{14}$  and  $R^{23}$  is a suitable protecting group such as acetyl or benzoyl (it will be appreciated that this route  
10 may also be used for compounds of the formula (I) where Y is other than CO).

Conventional deprotection conditions may be used and will depend on the nature of the protecting groups  $R^{21}$ ,  $R^{22}$  and  $R^{23}$  to be removed. Further, the skilled person will realise that the protecting groups  $R^{21}$ ,  $R^{22}$  and  $R^{23}$  may be removed all together, separately or in any combination to provide a compound  
15 of the formula (I). For example, where  $R^{5A}$  is  $CH_2OR^{23}$ , either  $R^{21}$  and  $R^{22}$  may first be deprotected followed then by  $R^{23}$ , or *vice-versa*. In a typical procedure where  $R^{21}$ ,  $R^{22}$  and  $R^{23}$  are each acetyl, the deprotection is achieved using a suitable inorganic base, e.g. sodium carbonate, sodium hydroxide, potassium hydroxide, lithium hydroxide, sodium carbonate, potassium carbonate or  
20 caesium carbonate, and in a suitable solvent, e.g. methanol, ethanol, isopropanol, 1,2-dimethoxyethane, tetrahydrofuran, dimethylformamide, acetone, 2-butanone or 4-methyl-2-pentanone, optionally under aqueous conditions, at from  $0^\circ C$  to the reflux temperature of the solvent, e.g. room temperature. Alternatively, the deprotection can be carried out using a suitable  
25 amine base such as triethylamine, diisopropylethylamine, 4-methylmorpholine, ammonia, methylamine, ethylamine or dimethylamine in a suitable solvent such

as methanol, ethanol, n-propanol, isopropanol, tetrahydrofuran or dichloromethane at from 0°C to the reflux temperature of the solvent, or using a sodium or potassium C<sub>1</sub>-C<sub>4</sub> alkoxide, e.g. sodium methoxide or ethoxide, in a corresponding C<sub>1</sub>-C<sub>4</sub> alkanol, e.g. methanol or ethanol.

- 5 In a typical procedure, where R<sup>21</sup> and R<sup>22</sup> taken together are 1,1-dimethylmethylene, a compound of the formula (XXI) may be deprotected by treatment with a suitable acid such as hydrochloric acid, trifluoroacetic acid, sulphuric acid, phosphoric acid, pyridinium p-toluenesulphonate, p-toluenesulphonic acid, benzenesulphonic acid, methanesulphonic acid, acetic  
10 acid or formic acid, or a mixture thereof, or an acidic ion-exchange resin, optionally in the presence of a suitable solvent, e.g. ethanol, and optionally under aqueous conditions. The reaction may be carried out at an elevated temperature such as at the reflux temperature of the solvent.

- Deprotection of a compound of the formula (XXI) to provide a compound  
15 of the formula (I) may also be accomplished *in situ* following the conversion of a compound of the formula (XXII) to a compound of the formula (XXI) as described below. Here, where R<sup>21</sup>, R<sup>22</sup> and R<sup>23</sup> are each acetyl, the deprotection method using inorganic base is preferred, e.g. the reaction mixture containing a compound of the formula (XXI) is treated with aqueous sodium  
20 hydroxide solution in 1,2-dimethoxyethane at from 5-20°C.

A compound of the formula (XXI) may be prepared by coupling a compound of the formula:

25

(XXII)

with a compound of the formula:

- 5 wherein  $Z^4$  is a suitable leaving group such as acetoxy, benzyloxy, methoxy or halo, e.g. chloro, under similar conditions to those previously described for the conversion of a compound of the formula (XII) to (XIII).

A compound of the formula (XXII) may be prepared using conventional procedures as illustrated in Scheme 3. Such methods may be adapted from  
 10 those previously described herein.

Scheme 3

wherein  $\text{R}^{24}$  is a suitable protecting group such as tetrahydro-2H-pyran-2-yl.

An acid of the formula (XXVI) may be prepared using conventional procedures, e.g. by basic hydrolysis of a compound of the formula (IX) such as by using aqueous sodium hydroxide solution followed by acidification in the work-up.

10

A compound of the formula (XXIII) may be prepared by conventional procedures.

A compound of the formula (XXI) where  $\text{R}^{5A}$  is  $\text{CONR}^{14}\text{R}^{14}$  may also be prepared as shown in Scheme 4.

5        The compound of the formula (XXX) prepared may be deprotected under conventional conditions, e.g. where  $R^{21-23}$  are each acetyl, using a suitable base such as sodium carbonate, potassium carbonate, sodium ethoxide, sodium methoxide or potassium tertiary-butoxide in the presence of a suitable alcohol solvent, e.g. ethanol, optionally in the presence of another solvent such as 1,2-  
10 dimethoxyethane, optionally in the presence of water and optionally at an elevated temperature for up to 24 hours, and also optionally directly using the crude reaction mixture from the previous step.

      The compound of the formula (XXXI) prepared may be protected with a suitable protecting group or suitable protecting groups. Where  $R^{21}$  and  $R^{22}$ ,  
15 taken together, represent 1,1-dimethylmethylene, this may be carried out by reaction with acetone, or a ketal of acetone, or a combination of both, in the presence of an acid such as hydrochloric acid, p-toluenesulphonic acid, methanesulphonic acid, sulphuric acid, phosphoric acid or trifluoroacetic acid, in a solvent such as acetone, toluene, dichloromethane or tetrahydrofuran,

      Alternatively, a compound of the formula (XXX) may be converted directly to a compound of the formula (XXXII) by selective enzymatic hydrolysis, e.g. using a suitable lipase enzyme.

25        The compound of the formula (XXXII) prepared may be oxidised to a carboxylic acid of the formula (XXXIII) in either one step by treatment with a suitable oxidising agent in a suitable solvent or in two steps by treatment first with a suitable oxidising agent in a suitable solvent to generate the corresponding aldehyde and then subsequent treatment with a suitable  
30 oxidising agent in a suitable solvent. Typical single step conditions include treatment of the primary alcohol with an oxidising agent such as chromic acid, sodium periodate, chromium trioxide, potassium permanganate, sodium

chlorite, sodium hypochlorite or oxygen, in a suitable solvent such as acetonitrile, dichloromethane, toluene or ethyl acetate, optionally in the presence of an appropriate catalyst such as ruthenium trioxide, ruthenium chloride, 2,2,6,6-tetramethylpiperidiny-1-oxy free radical or platinum, optionally

Alternatively, the alcohol of the formula (XXXII) is treated with 2,2,6,6-tetramethylpiperidiny-1-oxy free radical (catalytic amount) and sodium hypochlorite in dichloromethane in the presence of water, sodium bicarbonate and a catalytic amount of tetrabutylammonium bromide.

The carboxylic acid of the formula (XXXIII) prepared may be converted to an amide of the formula (XXXIV) using conventional coupling conditions such as by activating the acid using a suitable activating agent, optionally in the presence of a catalyst, and then treating with an excess of the amine of the formula:

in a suitable solvent. Typically, the reaction is carried out by treatment of the acid with an activating agent such as N,N'-carbonyldiimidazole, thionyl chloride, oxalyl chloride or phosphorus oxychloride in a solvent such as THF, DMF, ethyl acetate, acetonitrile, toluene, acetone or dichloromethane at a temperature of from 0 to 100°C for 1-20 hours, followed by addition of the amine or an acid addition salt thereof, optionally in the presence of a tertiary amine acid acceptor such as triethylamine, ethyldiisopropylamine or N-methylmorpholine, at from 0 to 100°C. ethyl-diisopropylamine in THF, DMF, dichloromethane or ethyl acetate at room temperature. Preferably the reaction is carried out by initial treatment of the acid with N,N'-carbonyldiimidazole in ethyl acetate, followed by addition of the amine, in THF.

5           The compound of the formula (XXXIV) prepared may be hydrolysed to provide a carboxylic acid of the formula (XXXV) under conventional ester hydrolysis conditions such as by using an alkali metal base in a suitable solvent in the presence of water, optionally at an elevated temperature, followed by treatment with acid to generate the carboxylic acid. In a typical reaction, the

in a suitable solvent. In a typical procedure the acid is treated with an activating agent such as N,N'-carbonyldiimidazole, thionyl chloride, oxalyl chloride or phosphorus oxychloride in a solvent such as THF, DMF, ethyl acetate, acetonitrile, toluene, acetone or dichloromethane at from 0 to 100°C, followed by addition of the amine or an acid addition salt thereof, optionally in the presence of a tertiary amine such as triethylamine, ethyldiisopropylamine or N-methylmorpholine, at from 0 to 100°C. Alternatively, the acid is reacted with 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride or N,N'-dicyclohexylcarbodiimide then 1-hydroxy-7-azabenzotriazole or 1-

hydroxybenzotriazole hydrate, followed by the amine in the presence of an excess of 4-methylmorpholine, triethylamine or ethyldiisopropylamine in THF, DMF, ethyl acetate, acetonitrile, toluene, acetone or dichloromethane, at room temperature. The reaction can also be carried out by reacting the acid with

A compound of the formula (XXXIII) may also be prepared as shown in

15 Scheme 5.

A triol of the formula (XXXI) may be selectively oxidised to provide a diol

20 of the formula (XXXVII), typically using a selective oxidising agent such as sodium hypochlorite in the presence of a catalytic amount of 2,2,6,6-

tetramethylpiperidiny-1-oxy free radical and bromide ion (provided as sodium bromide, potassium bromide or tetraalkylammonium bromide), or using oxygen in the presence of a platinum catalyst, in a suitable solvent such as water, acetonitrile, dichloromethane, toluene or ethyl acetate or in a mixture of an  
 5 organic solvent and water together with a phase transfer catalyst such as tetrabutylammonium bromide, tetrabutylammonium chloride or benzyltriethylammonium chloride.

The diol of the formula (XXXVII) may be protected using a suitable protecting group or suitable protecting groups. Where the protecting group is  
 10 1,1-dimethylmethylene this may be achieved by reaction with acetone, or a derivative of acetone, in the presence of an acidic reagent. In a typical reaction the diol is reacted with acetone, or a ketal of acetone such as 2,2-dimethoxypropane, or a combination of both, in the presence of an acid such as hydrochloric acid, p-toluenesulphonic acid, methanesulphonic acid, sulphuric

In a typical procedure, a compound of the formula (XXI) where  $R^{5A}$  is  $CH_2OR^{23}$  where  $R^{21-23}$  are suitable protecting groups such as acetyl is deprotected under conventional conditions such as by treatment with a base such as sodium hydroxide, potassium hydroxide, sodium carbonate, potassium carbonate, sodium ethoxide, sodium methoxide or potassium tertiary-butoxide in a suitable alcohol solvent, optionally in the presence of another solvent such as 1,2-dimethoxyethane, optionally in the presence of water and optionally at an elevated temperature.

The compound of the formula (XXXVIII) prepared may be selectively protected under conventional conditions. Where  $R^{21}$  and  $R^{22}$ , taken together, represent 1,1-dimethylmethylene, this may be achieved by reacting the triol with acetone, or a ketal of acetone such as 2,2-dimethoxypropane, or a combination of both, in the presence of an acid such as hydrochloric acid, p-toluenesulphonic acid, methanesulphonic acid, sulphuric acid, phosphoric acid

or trifluoroacetic acid and in a solvent such as acetone, toluene, dichloromethane or tetrahydrofuran, optionally at elevated temperature.

Alternatively, a compound of the formula (XXI) may be converted directly to a compound of the formula (XXXIX) by selective enzymatic hydrolysis, e.g.

5 using a suitable lipase enzyme.

The alcohol of the formula (XXXIX) may be oxidised to an acid of the formula (XXXX) using similar conditions to those previously described for the conversion of a compound of the formula (XXXII) to (XXXIII).

10 The acid of the formula (XXXX) may be converted to an amide of the formula (XXI) using similar conditions to those previously described for the conversion of a compound of the formula (XXXIII) to (XXXIV).

4. A compound of the formula (I) wherein Y is CS may be prepared by the  
15 reaction of a compound of the formula:

20 formula (II), followed by reaction of the intermediate of the formula:

10 All of the above reactions and the preparations of novel starting materials using in the preceding methods are conventional and appropriate reagents and reaction conditions for their performance or preparation as well as procedures for isolating the desired products will be well-known to those skilled in the art with reference to literature precedents and the Examples and  
15 Preparations hereto. In particular, suitable protection and deprotection procedures are well-known in the art, e.g. as described in Greene *et al*, "Protective Groups in Organic Synthesis", Third Edition, John Wiley & Sons Ltd..

A pharmaceutically acceptable salt of a compound of the formula (I) may  
20 be readily prepared by mixing together solutions of a compound of the formula (I) and the desired acid or base, as appropriate. The salt may precipitate from solution and be collected by filtration or may be recovered by evaporation of the solvent.

The anti-inflammatory properties of the compounds of the formula (I) are  
25 demonstrated by their ability to inhibit neutrophil function which indicates A2a receptor agonist activity. This is evaluated by determining the compound profile in an assay where superoxide production was measured from neutrophils activated by fMLP. Neutrophils were isolated from human peripheral blood using dextran sedimentation followed by centrifugation through Ficoll-Hypaque  
30 solution. Any contaminating erythrocytes in the granulocyte pellet were removed by lysis with ice-cold distilled water. Superoxide production from the neutrophils was induced by fMLP in the presence of a priming concentration of

cytochalasin B. Adenosine deaminase was included in the assay to remove any endogenously produced adenosine that might suppress superoxide production. The effect of the compound on the fMLP-induced response was monitored colorimetrically from the reduction of cytochrome C within the assay buffer.

- 5 The potency of the compounds was assessed by the concentration giving 50% inhibition ( $IC_{50}$ ) compared to the control response to fMLP.

The compounds of the formula (I) can be administered alone but will generally be administered in admixture with a suitable pharmaceutical excipient, diluent or carrier selected with regard to the intended route of  
10 administration and standard pharmaceutical practice.

For example, the compounds of the formula (I) can be administered orally, buccally or sublingually in the form of tablets, capsules, multi-particulates, gels, films, ovules, elixirs, solutions or suspensions, which may contain flavouring or colouring agents, for immediate-, delayed-, modified-,  
15 sustained-, pulsed- or controlled-release applications. The compounds of the formula (I) may also be administered as fast-dispersing or fast-dissolving dosage forms or in the form of a high energy dispersion or as coated particles. Suitable formulations of the compounds of the formula (I) may be in coated or uncoated form, as desired.

20 Such solid pharmaceutical compositions, for example, tablets may contain excipients such as microcrystalline cellulose, lactose, sodium citrate, calcium carbonate, dibasic calcium phosphate, glycine and starch (preferably corn, potato or tapioca starch), disintegrants such as sodium starch glycollate, croscarmellose sodium and certain complex silicates, and granulation binders  
25 such as polyvinylpyrrolidone, hydroxypropylmethylcellulose (HPMC), hydroxypropylcellulose (HPC), sucrose, gelatin and acacia. Additionally, lubricating agents such as magnesium stearate, sodium stearyl fumarate, sodium lauryl sulphate, stearic acid, glyceryl behenate and talc may be included.

30

#### General Example

A formulation of the tablet could typically contain from 0.01mg to 500mg of active compound whilst tablet fill weights may range from 50mg to 1000mg. An example of a formulation for a 10mg tablet is illustrated below:

5	<u>Ingredient</u>	<u>%w/w</u>
	Compound of the formula (I) or salt	10.000*
	Lactose	64.125
	Starch	21.375
	Croscarmellose sodium	3.000
10	Magnesium Stearate	1.500

\* Quantity adjusted in accordance with drug activity.

The tablets can be manufactured by a standard process, for example, direct  
 15 compression or a wet or dry granulation process. The tablet cores may be coated with appropriate overcoats.

Solid compositions of a similar type may also be employed as fillers in  
 20 gelatin or HPMC capsules. Preferred excipients in this regard include lactose, starch, a cellulose, milk sugar or a high molecular weight polyethylene glycol. For aqueous suspensions and/or elixirs, the compounds of the formula (I) may be combined with various sweetening or flavouring agents, colouring matter or dyes, with emulsifying and/or suspending agents and with diluents such as  
 25 water, ethanol, propylene glycol or glycerin, and combinations thereof.

The compounds of the formula (I) can also be administered parenterally, for example, intravenously, intra-arterially, intraperitoneally, intrathecally, intraventricularly, intraurethrally, intrasternally, intracranially, intramuscularly or subcutaneously, or they may be administered by infusion or needleless  
 30 injection techniques. For such parenteral administration, they are best used in the form of a sterile aqueous solution which may contain other substances, for example, a co-solvent and/or enough salts or glucose to make the solution

isotonic with blood. The aqueous solutions should be suitably buffered (preferably to a pH of from 3 to 9), if necessary. The preparation of suitable parenteral formulations under sterile conditions is readily accomplished by standard pharmaceutical techniques well-known to those skilled in the art.

5 For oral and parenteral administration to human patients, the daily dosage level of the compounds of the formula (I) will usually be from 0.00001 to 100 mg/kg, preferably from 0.0001 to 100 mg/kg (in single or divided doses).

Thus tablets or capsules of the compound of the formula (I) may contain from 0.01 to 500 mg of active compound for administration singly or two or  
10 more at a time, as appropriate. The physician in any event will determine the actual dosage which will be most suitable for any individual patient and it will vary with the age, weight and response of the particular patient. The above dosages are exemplary of the average case. There can, of course, be individual instances where higher or lower dosage ranges are merited and such are within  
15 the scope of this invention.

The compounds of formula (I) can also be administered intranasally or by inhalation and are conveniently delivered in the form of a dry powder inhaler or an aerosol spray presentation from a pressurised container, pump, spray, atomiser (preferably an atomiser using electrohydrodynamics to produce a fine  
20 mist) or nebuliser, with or without the use of a suitable propellant, e.g. dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, a hydrofluoroalkane such as 1,1,1,2-tetrafluoroethane (HFA 134A [trade mark]) or 1,1,1,2,3,3,3-heptafluoropropane (HFA 227EA [trade mark]), carbon dioxide, a further perfluorinated hydrocarbon such as Perflubron (trade mark) or other  
25 suitable gas. In the case of a pressurised aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurised container, pump, spray, atomiser or nebuliser may contain a solution or suspension of the active compound, e.g. using a mixture of ethanol (optionally, aqueous ethanol) or a suitable agent for dispersing, solubilising or extending  
30 release and the propellant as the solvent, which may additionally contain a lubricant, e.g. sorbitan trioleate. Capsules, blisters and cartridges (made, for example, from gelatin or HPMC) for use in an inhaler or insufflator may be

formulated to contain a powder mix of a compound of the formula (I), a suitable powder base such as lactose or starch and a performance modifier such as l-leucine, mannitol or magnesium stearate.

A suitable solution formulation for use in an atomiser using  
 5 electrohydrodynamics to produce a fine mist may contain from 1  $\mu$ g to 10mg of a compound of the formula (I) or a salt thereof and the actuation volume may vary from 1 to 100  $\mu$ l. A typical formulation may comprise a compound of the formula (I) or salt thereof, propylene glycol, sterile water, ethanol and sodium chloride.

10 Aerosol or dry powder formulations are preferably arranged so that each metered dose or "puff" contains from 1 to 4000  $\mu$ g of a compound of the formula (I) for delivery to the patient. The overall daily dose with an aerosol will be in the range of from 1  $\mu$ g to 20mg which may be administered in a single dose or, more usually, in divided doses throughout the day.

15 Alternatively, the compounds of the formula (I) can be administered in the form of a suppository or pessary, or they may be applied topically in the form of a lotion, solution, cream, ointment or dusting powder. The compounds of the formula (I) may also be dermally or transdermally administered, for example, by the use of a skin patch. They may also be administered by the  
 20 pulmonary, vaginal or rectal routes.

For application topically to the skin, the compounds of the formula (I) can be formulated as a suitable ointment containing the active compound suspended or dissolved in, for example, a mixture with one or more of the following: mineral oil, liquid petrolatum, white petrolatum, propylene glycol,  
 25 polyoxyethylene polyoxypropylene compound, emulsifying wax and water. Alternatively, they can be formulated as a suitable lotion or cream, suspended or dissolved in, for example, a mixture of one or more of the following: mineral oil, sorbitan monostearate, a polyethylene glycol, liquid paraffin, polysorbate 60, cetyl esters wax, cetearyl alcohol, 2-octyldodecanol, benzyl alcohol and water.

30 The compounds of the formula (I) may also be used in combination with a cyclodextrin. Cyclodextrins are known to form inclusion and non-inclusion complexes with drug molecules. Formation of a drug-cyclodextrin complex may

modify the solubility, dissolution rate, bioavailability and/or stability property of a drug molecule. Drug-cyclodextrin complexes are generally useful for most dosage forms and administration routes. As an alternative to direct complexation with the drug the cyclodextrin may be used as an auxiliary  
 5 additive, e.g. as a carrier, diluent or solubiliser. Alpha-, beta- and gamma-cyclodextrins are most commonly used and suitable examples are described in WO-A-91/11172, WO-A-94/02518 and WO-A-98/55148.

The major fraction (11.4 g) was dissolved in dichloromethane (264 ml) and was filtered to remove insoluble matter. To this solution was added diethyl ether (112 ml) and the resultant cloudy mixture was stirred at ambient temperature for 1 hour. The solids were then collected by

Lithium aluminium hydride (66ml of a 1 molar solution in tetrahydrofuran,  
 5 0.066mol) was added to a stirred solution of  
 [cyclopentyl(isopropyl)amino]acetonitrile (10g, 0.66mol) (Preparation 24) in  
 tetrahydrofuran (100ml) at 0°C. The reaction mixture was stirred at 0°C for 20  
 minutes and then heated under reflux for 2 hours. The reaction mixture was  
 allowed to cool to room temperature and left to stand overnight. The reaction  
 10 mixture was cooled in an icebath and treated dropwise with 4.8ml of a 7.5%  
 w/w aqueous sodium hydroxide solution followed by 7.4 ml of water. The  
 solvent was removed under reduced pressure and the residue slurried with  
 diethyl ether (200ml) for 30 minutes and then filtered. The filtrate was  
 evaporated under reduced pressure to give the title compound as a colourless  
 15 oil (10.30g).

To a solution of crude ethyl 9-[(2R,3R,4S,5R)-3,4-dihydroxy-5-(hydroxymethyl)tetrahydro-2-furanyl]-6-[(2,2-diphenylethyl)amino]-9H-purine-2-carboxylate (Preparation 65) (62.7g, assumed 0.103 moles) in dry acetone (314 ml) under an atmosphere of nitrogen was added concentrated sulphuric acid (5.3 ml, 0.103 moles) and the resultant mixture was stirred at ambient temperature for 2.5 hours. 2,2-Dimethoxypropane (21.5 g, 25.4 ml, 0.207 moles) was then added and stirring was continued for a further 2.5 hours. The reaction mixture was then added to saturated aqueous sodium bicarbonate solution (300 ml) and the resultant mixture was stirred at ambient temperature for 0.2 hours. The mixture was concentrated *in vacuo* and the aqueous residue was extracted with ethyl acetate (400 ml then 200 ml). The organic phases were combined and washed with saturated brine (300 ml), dried over anhydrous magnesium sulphate and concentrated *in vacuo* to give a yellow foam (58.2 g). A solution of this material in *tertiary*-butyl methyl ether (250 ml) was stirred at ambient temperature, under an atmosphere of nitrogen, to give a suspension that was then cooled in ice for 1 hour and the solid was then collected by filtration. The filter cake was washed with cold *tertiary*-butyl methyl ether (50 ml) and the product was dried *in vacuo* to give the title compound as a colourless solid (12.7 g). The mother liquors were purified by flash chromatography on silica gel (400 g) eluting with 75% v/v ethyl acetate in

heptane to give slightly impure product (32.9g) as a foam that was crystallised from *tertiary*-butyl methyl ether (150 ml) to give more title compound (8.3 g). The mother liquors were again concentrated *in vacuo* to give a foam (23.2 g) that was purified by flash chromatography eluting using a gradient system of

5 50% v/v ethyl acetate in toluene changing to 90% v/v ethyl acetate in toluene to give 2 fractions (9.7 g and 11.8 g) that were separately crystallised from *tertiary*-butyl methyl ether (100 ml and 120 ml respectively) to give more title compound (6.6g and 8.8 g respectively). The total yield of the title compound was therefore 36.4 g, and it was isolated as a colourless crystalline solid, m.p. 126-
